

Think Green. Act Green. Trust JAS Filtration's Expertise

Sustainable development is a whole lot more than a trend or a temporary fashion; it's an attitude that allows the adoption of solutions and tools to reduce the impact of human activities on our planet and for our health. Many people already have understood that now is the time to make concrete gestures everyday at a personal level.

JAS Filtration is proud to join the effort by offering a wide range of air filtration products whose characteristics favor sustainable development. These products allow a decrease of global energy consumption and diminishes greenhouse gases. That is why we offer high quality products meeting the most demanding environmental criteria, such as:

- LEED (Leadership in Energy and Environmental Design) Certification of the Canada Green Building Council, that encourages and accelerates global adoption of sustainable green building and development practices through the creation and implementation of universally understood and accepted tools and performance criteria.
- BOMA BEST, is a national program to address an industry need for realistic standards for energy and environmental performance of existing buildings based on common standards and an array of educational and on-line assessment tools, independent data audits, and a four-level performance certification program.

In the past few years, several products capable of helping anyone meet those sustainable development programs were added to JAS Filtration's product catalogue. As the LEED and BOMA BEST standards are pretty stringent, it is imperative to consider the cost of air filtration (filter cost + filter change cost + energy cost to force the air through the filters) in any analysis done to meet these objectives. In average, filter cost represents a mere 20 to 30 percent of the overall air filtration expenses. Therefore, a better filter choice, even if a tad more expensive, can generate interesting savings while reducing greenhouse gases.

Understanding this dynamic here at JAS Filtration, we want to make sure the green choice is as easy as it gets for our customers. This is why we place our expertise at your disposition and free of charge in order to help you meet your air quality objectives while encouraging sustainable development.
